

HOME

I HAVE QUESTIONS.

I'M LEARNING HOW TO FIND THE ANSWERS.

Hi, I'm Shaurya.

I'm 14, a Class X student at Adani International School, Ahmedabad, and I'm curious about how things work — especially when science, technology and healthcare come together.

I'm interested in life sciences, scientific research and technology. Over the last few years, I've been learning what happens when a question turns into a research problem, an idea turns into a project, and a project gets tested on a national stage.

Outside academics, I love playing the guitar.

I'm still figuring out exactly where all these interests will take me.

For now, I'm enjoying the journey.

EXPLORE MY JOURNEY →

ABOUT

SO, WHO AM I?

I'm still figuring that out.

I'm a student, researcher and someone who enjoys following a question until I understand it a little better.

My interests currently lie at the intersection of **life sciences, healthcare, technology and scientific innovation.**

My research journey has taught me that finding an answer isn't always the most important part. Sometimes, asking the right question is.

I've learned to look at a problem from different perspectives, understand the science behind it, work with data, listen to people with different areas of expertise and be willing to change my thinking when the evidence tells me to.

And then there's music.

When I'm not researching or studying, I love playing the guitar. It gives me a completely different way to think and express myself.

WHAT I'M CURIOUS ABOUT

SCIENCE

I like understanding how things work and what happens when we look at familiar problems differently.

HEALTHCARE

I'm interested in how science and technology can help us understand health better and potentially identify risks earlier.

AI & TECHNOLOGY

I'm curious about how data, technology and artificial intelligence can help solve real-world problems.

MUSIC

I love playing the guitar. It's my way of stepping away from research and letting creativity take over.

MY JOURNEY SO FAR

My interest in research eventually led me towards healthcare and preventive health.

I started exploring how complex health information could be brought together in a way that might be easier to understand.

That exploration became my current research project, **EarlyDetect-AI**.

It has taken me from defining a clinical question and reviewing scientific literature to working alongside medical, biostatistics and digital-health teams.

It has also taken me to the IRIS National Fair, where I've had the opportunity to present my work at a national level.

I've been fortunate to win Gold at IRIS for two consecutive years and, following my 2025 win, represent India at the Regeneron International Science and Engineering Fair in Columbus, Ohio.

But I see these as milestones in the journey, not the destination.

PROJECT

EARLYDETECT-AI

A UNIFIED METABOLIC HEALTH SCORE

THE QUESTION I STARTED WITH

Can we make complex health information easier to understand?

Health information can often feel fragmented.

A person may receive information through different test reports, clinical measurements, health apps and diagnostic indicators, but there isn't always one simple way to understand what all of it means together.

That made me curious.

Could there be a way to bring these different pieces together?

MY IDEA

My research explores the concept of a **unified Metabolic Health Score** — an interpretable, single-number metric that brings together clinical biomarkers, lifestyle factors and diagnostic information to provide a more holistic view of an individual's metabolic health.

The idea is conceptually similar to a financial credit score.

Instead of looking at different pieces of information separately, the proposed score could bring them together into one metric that helps communicate an individual's overall metabolic health trajectory.

WHAT I'M TRYING TO EXPLORE

The proposed score is designed to potentially:

01

Bring different health indicators together.

02

Stratify metabolic risk into low, moderate and high-risk categories.

03

Identify which health domains contribute most to an individual's risk.

04

Track how that risk changes over time.

05

Explore how digital or clinical interventions could potentially be more personalised.

WHAT I'VE WORKED ON

I've been involved across the research process.

I started by helping define the clinical question and identify the focus disorders.

I reviewed scientific literature and prepared outcome summaries.

I supported variable selection and contributed to data cleaning and quality-assurance processes alongside medical, biostatistics and digital-health teams.

I've also developed an understanding of the ethical considerations involved in working with anonymised patient data.

WHY THIS MATTERS TO ME

My research currently looks at conditions including **type 2 diabetes, obesity, MASLD and PCOS**, where people can receive health information across separate reports, platforms and clinical measurements.

I'm interested in whether bringing some of that information together could help people understand their health trajectory more clearly and potentially identify risks earlier.

The project also has an exploratory oncology dimension, looking at potential relationships between metabolic health and patterns associated with cancer risk.

This part of my research is still preliminary and continues to evolve as data collection progresses.

WHAT I'VE LEARNED

Research has taught me that the first idea isn't always the best idea.

I've learned to question my assumptions, look for evidence, listen to people with different expertise and accept that a project can change significantly as you learn more.

I've also learned that working on something meaningful requires patience.

The research is still evolving. And I'm still learning.

BEYOND ACADEMICS

THERE'S MORE TO ME THAN RESEARCH.

Science is a big part of my life, but it isn't all of it.

I'm still discovering the things that make me curious, excited and sometimes completely lose track of time.

MUSIC

SIX STRINGS. A DIFFERENT WAY OF THINKING.

I love playing the guitar.

Music gives me a completely different space from research and academics.

When I'm playing, I'm not thinking about datasets, health scores or research questions.

I'm just listening, practising, experimenting and trying to get better.

And maybe that's why I enjoy it so much.

THINGS I'M CURIOUS ABOUT

I'm interested in a lot of things, and I don't think I need to choose just one yet.

AI

I'm curious about how artificial intelligence recognises patterns and how it can be applied to real-world problems.

HEALTHCARE

I want to understand how technology and research can contribute to better health outcomes.

LIFE SCIENCES

I'm fascinated by the science behind the human body and the complexity of how different systems interact.

RESEARCH

I enjoy the process of taking something I don't understand and gradually making sense of it.

MUSIC

I'm interested in the relationship between patterns, creativity and expression.

OUTSIDE THE CLASSROOM

Some of my most valuable learning has happened outside a classroom.

Research competitions have taught me how to present and defend an idea.

Working with different teams has taught me to listen.

Travelling for competitions has exposed me to people and ideas I wouldn't otherwise have encountered.

And playing music has reminded me that learning doesn't always have to have a measurable outcome.

MEDIA

MY JOURNEY IN THE NEWS

This is where I document some of the moments from my research journey that have made it beyond the classroom.

IRIS NATIONAL FAIR 2025-26

I was fortunate to win Gold at the IRIS National Fair for the second consecutive year.

At the 2025-26 National Fair, 120 projects by 152 students were evaluated. My research focused on developing a unified Metabolic Health Score for metabolic health risk stratification.

For me, the experience was about much more than the medal.

It was an opportunity to present my research, explain the thinking behind it and learn from other students working on ideas of their own.

REPRESENTING INDIA

In 2025, after winning Gold at IRIS, I had the opportunity to represent India at the **Regeneration International Science and Engineering Fair (ISEF)** in Columbus, Ohio.

Representing India at an international science fair was an experience I'll always remember.

It gave me the opportunity to see how students from different parts of the world approach scientific questions — and reminded me how much there is still to learn.

MEDIA & MOMENTS

ON STAGE

Presentations, competitions and award ceremonies.

IN THE LAB / IN THE PROCESS

The work, research and preparation behind the final project.

BEHIND THE SCENES

The people, experiences and moments that don't always make it into the final presentation.

AWARDS

MILESTONES ALONG THE WAY

I don't think achievements define who I am.

But they do mark important moments in my journey.

2026

GOLD MEDAL

IRIS NATIONAL FAIR 2025–26

I won Gold for my research exploring a unified Metabolic Health Score.

This was my **second consecutive Gold at IRIS.**

2025

GOLD MEDAL

IRIS NATIONAL FAIR

My Gold-winning research led to an opportunity to represent India at the Regeneron International Science and Engineering Fair.

REPRESENTED INDIA

REGENERON ISEF 2025

Columbus, Ohio, USA.

MORE TO COME

I'm hoping this page never feels finished.

There are still competitions to enter, ideas to explore, projects to build and — probably most importantly — things to get wrong and learn from.

CONTACT

LET'S CONNECT.

If you'd like to know more about my research, projects or journey, I'd love to hear from you.

For **media, academic collaborations, research conversations or other enquiries**, please get in touch through my contact below.

ONE LAST THING

I'M 14.

There is a lot I don't know yet.

I don't have my entire future figured out.

And I don't think I need to.

Right now, I want to keep asking questions.

Keep learning.

Keep experimenting.

Keep playing.

Keep building.

AND SEE WHERE IT TAKES ME.
